High levels of vibration are indicative of high levels of component stress, high noise levels and reduced machine fatigue life. Measurements are usually taken of the system vibration amplitude, phase and frequency. These measurements can be processed and displayed in such a way as to enable judgments to be made about the condition of the machine.

Sound is the mechanical vibrations of particles in a medium. When a sound wave is introduced in a material, the particles in the material vibrate about a fixed point at the same frequency as the sound wave. The particles do not travel with the wave but react to the energy of the wave. It is the energy of the wave that moves through the material.

Vibrations are oscillations in mechanical dynamic systems. Although any system can oscillate when it is forced to do so externally, the term "vibration" in mechanical engineering is often reserved for systems that can oscillate freely without applied forces.

VIBRATIONS FROM MECHANICAL EQUIPMENT The vibrations produced from up-and-down, side-to-side, or rocking motion by mechanical equipment in buildings can be felt (< 20 Hz) and heard by building occupants. When vibrations are accompanied by noise, they tend to be more annoying.

Chapter 5: Mechanical System Noise and Vibrations ...

The mechanical system vibrates at one or more of its natural frequencies and damps down to motionlessness. Forced vibration is when a time-varying disturbance (load, displacement or velocity) is applied to a mechanical system. The disturbance can be a periodic and steady-state input, a transient input, or a random input.
