Computer program subroutine FLUID calculates thermodynamic and transport properties of pure fluids in liquid, gas, or two-phase (liquid/gas) conditions. Program determines thermodynamic state from assigned values for temperature and density, pressure and density, temperature and pressure, pressure and entropy, or pressure and enthalpy.

The compositional variations of the thermodynamic and mass transport properties of the  $\beta$  phase in the lithium-aluminum system have been investigated over the temperature range from 415° to 600°C. At 415°C, the emf of the single phase lies between 300 and 70 mV relative to pure Li and this corresponds to a Li activity increasing from 0.0063 to 0.31 over the phase stability range from 46 B ...

Libraries of thermodynamic data and transport properties are given for individual species in the form of least-squares coefficients. Values of heat capacity Cp(T), enthalpy H\*(T), and entropy S\*(T) are available for 1130 solid, liq-uid, and gaseous species. Viscosity and thermal conductivity data are given for 155 gases. The original Cp(T) values were

The transport properties (viscosity, thermal conductivity and diffusion coefficient) of liquids and gases (fluids) are important for the most efficient engineering design of many processes in the oil, chemical and biotechnological industries. They characterize the response of a fluid to changes in its temperature, speed of flow or composition.

In this paper, we have presented first-principles study of elastic, electronic, thermodynamic and thermoelectric transport properties of TaCoSn by using density functional theory (DFT) and semi-classical Boltzmann transport theory. We have calculated elastic constants and moduli of elasticity, anisotropy, Vickers hardness.
